

RECKN

Keep assets native. Settle on proof.

An escrow that releases only when the work it was funded against can be re-executed and reproduced — and refunds the buyer when it cannot.

Live on Arc testnet. psyto.github.io/reckn

BEFORE ANYTHING IS EXPLAINED

A funded escrow.

A real proof.

Watch it fail to take the money.

Everything on the next screen is a real transaction on a live chain.

THE PROBLEM

Two parties decide whether you get paid.
Neither can see the work.

IN THE WAY	WHAT IT IS ASKED TO DECIDE	WHAT IT CAN ACTUALLY SEE
A human approver, a TEE, a resolver	Was the work done?	A claim somebody wrote
A bridge	Does the asset arrive?	Nothing about the work at all

THE INVERSION

Don't move the asset to reach the work.

Move a proof of the work to reach the asset.

The buyer escrows the stablecoin on the chain it already lives on. The seller works wherever the work belongs. The disputed execution is replayed — release if it reproduces, refund if it does not.

Don't make a bridge decide where money goes. Make proof decide.

NOBODY DECIDES — AS A BUILD CONDITION

No owner. No admin. No resolver. No upgrade path.

Not a promise. If one ever appears, **the build fails** — and the surface it guards is exactly three functions.

THE WHOLE SURFACE

`fund · settleWithProof · refundAfterDeadline`

THE TIMEOUT

Permissionless, and it pays the caller **nothing**.

WHAT IT REMOVES

Not a fee. The person.

An escrow a human approves is a serialisation point. Agents run in parallel, at machine speed, and every release queues behind somebody reading something.

THE PLATFORM'S CUT

10–20%

A symptom of that person existing.

DECIDING ONE OF OURS

<3¢

Computed from the receipts on the next screen.

WHAT CROSSES THE BOUNDARY

RECKN / CROSS-VM SETTLEMENT

The proof crosses. The USDC does not.

A Solana computation is re-executed in a zkVM; Arc settles only from the verified result.

The proof crosses. **The asset never does.** No bridge. No light client. No resolver on the path that chooses the payout.

IT IS RUNNING

Four settlements on Arc testnet.

SETTLEMENTS

4

Real testnet USDC, both directions.

DECIDED BY SOLANA PROOFS

2

One escrow, two virtual machines.

COST TO DECIDE ONE

<3¢

Computed from the receipts, not quoted.

WHAT THIS DOES NOT CLAIM

The half that is easy to leave out.

Not	"Bridges are unnecessary."	It removes the bridge as the decider . Moving funds to where you pay is a different problem.
Not	"Fragmented liquidity is solved."	You must already hold the settlement asset on the chain you pay from.
Not	"We prove Solana mainnet state."	The guest recomputes a bank hash over the account set the deal named . Consistency, not provenance.

Stated on the live page, in the film, and in a test — not in a footnote.

RECKN

Keep assets native. Settle on proof.

Reproduce, or refund.
